Several lighting areas - one network

The new showroom of one of the leading lighting manufacturers for architectural and landscape lighting in South Africa was recently upgraded with the light management system Blu2Light. Regent Lighting Solutions (RLS) searched for a system to manage and control their showrooms for colour temperature and lensing as well as for interior lighting in an easy way. The Bluetooth-based system, Blu2Light allows it to be installed in different areas but still work in one network.

Perfect balance between art and technology

Several sensors ensure various lighting scenes, like a welcome scene when presence is detected. Thereafter it is possible to control each luminaire and lighting group via the LiNA Touch App. In this case the app enables interaction with customers by showing how CRI and Kelvin are displayed and compared. Through this on-demand demonstration, a better and immediate understanding is achieved.

With the light management system Blu2Light a perfect balance between art and technology is easily possible and simple to apply.

About the company

Regent Lighting Solution is one of South Africa's leading lighting manufacturers for architectural and landscape lighting. The company has a very high reputation and a high regard for customer service, design and product quality. RDL Consulting took over both the technical installation support and the commissioning of the system on site and is more than enthusiastic about the intuitive control.
